EXPERIMENT 11

Deploying a Zoho Creator Application from Development to Production Environment

Name: Sowbarniga A | **Roll Number:** 241401104

Aim

To demonstrate the development-to-production deployment workflow of a Zoho Creator application using the Environments feature, and to manage a multi-stage pipeline of isolated sandboxes (Development, Stage and Production) so that changes are built, tested and released in a controlled manner.

Introduction to Multi-Stage Deployment

Zoho Creator provides an Environments feature, described on its page as a multi-stage deployment space to test and publish an application without affecting the production. Each environment is a separate, isolated copy of the application hosted in the cloud, with its own version of the forms, reports, workflows and data. A change made in one environment does not reach the next until it is deliberately deployed. An application passes through three environments:

Environment	Purpose
Development	The sandbox in which the application is built, configured and changed. Changes made here do not reach end users.
Stage	An intermediate testing environment, a replica of the release candidate, in which the application is deployed, tested and approved before release.
Production	The live environment in which the tested application is published and used by end users.

Why isolated workspaces matter

Because the three environments are isolated, unfinished or unverified work can never disturb the live application. Structural changes such as new fields, altered validation, rewritten workflows or changed permissions are first made in Development, where a failure affects only the developer. The change is then promoted to Stage, where it is tested against realistic conditions without touching real policyholders. Only after it is approved is it published to Production. This protects the active insurance claim request pipeline from system downtime, broken forms, lost or corrupted claim requests and unverified structural changes, and keeps every release controlled, traceable and reversible through Version History.

Application Used

Insurance Claim Request Form – an application to manage insurance claim requests from customers, including claimant details, policy information, incident details and claim status.

Procedure

The deployment follows the flow: Development Environment → Stage Environment → Production Environment.

Note: Figures 11.1 and 11.2 are screenshots from the Zoho Creator account used for this experiment. Figures 11.3 and 11.4 are illustrative views created to demonstrate the stages of the deployment workflow; they are not captures of a completed deployment. The sample statuses and dates in them are for illustration only.

1. Sign in to Zoho Creator. The home page shows the Insurance Claim Request applications. The left panel is divided into the groups DEVELOP, DEPLOY and MANAGE; the DEPLOY group contains the Environments, Mobile and Portal options. The Environments option (highlighted in red) is used for deploying applications across environments.

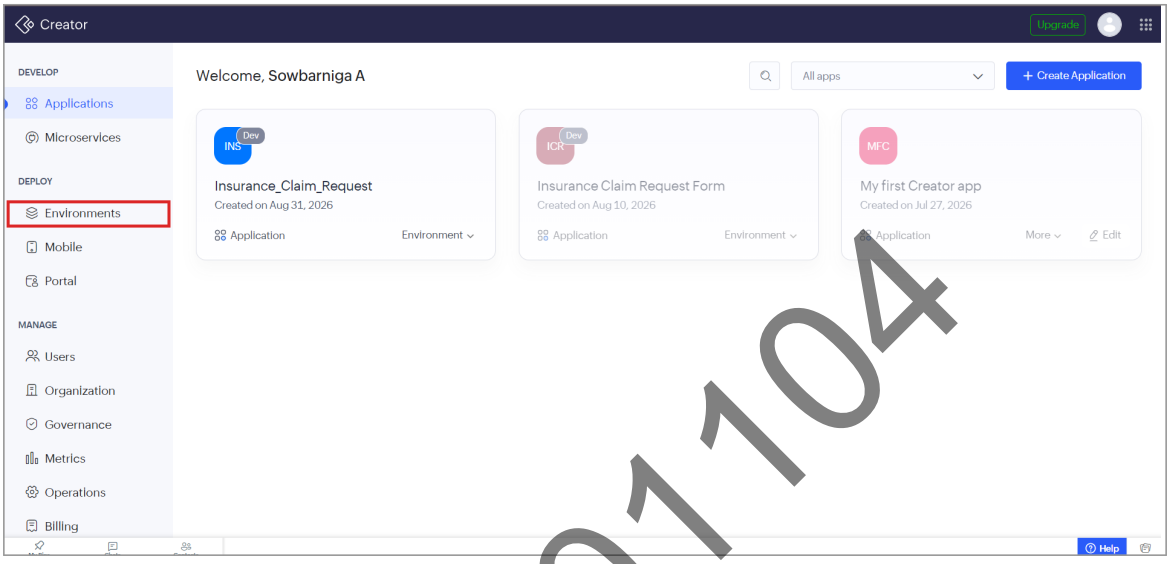

Figure 11.1: Zoho Creator Home – Insurance Claim Request Applications and the DEPLOY → Environments Option

2. Select **Environments** under DEPLOY. The Environments page opens with the description "Multi-stage deployment space to test and publish your application without affecting the production", and with the Version History, Manage and Publish options at the top. The Stage and Production environments are shown as separate columns. The applications added to the environment are listed in the left panel with the status "Changes available", and the Stage and Production columns show "Not yet published" for each of them.

3. If the application is not listed, select **Add Application** and add the Insurance Claim Request Form application to the environment. Once the application is published, version **1.0** is listed under the Stage and Production columns and the status of the application changes to “No changes available”. The Version History, Manage and Publish options are used to manage releases (Figure 11.3).

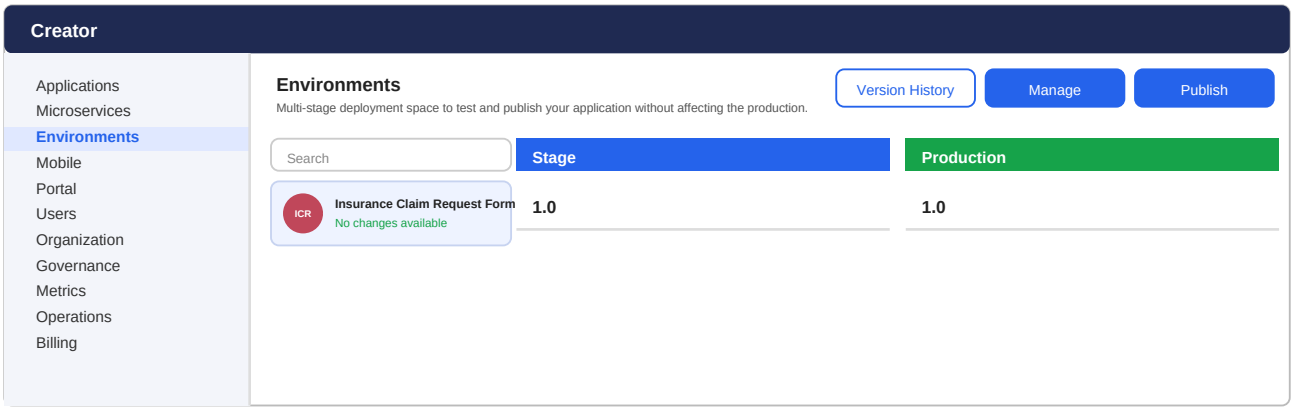

Figure 11.3: Environments Page – Application with Version 1.0 in Stage and Production (Illustrative)

4. **Development environment:** the application is built and configured here. Its status is shown as *Deployed* with the description “Application configured and ready for deployment”.
5. **Stage environment:** the application is deployed to Stage, tested and approved. Its status is *Deployed* with the description “Application tested and approved in Stage”.
6. **Production environment:** after approval in Stage, the application is published to Production. The Production tab is selected, the Environment is Production and the status is **Live**, with the message “The application is published and live in Production.” The Deployment Progress panel shows Production as Live – “Application is live and accessible to end users” (Figure 11.4).

Infrastructure Timeline

The progression of the application from inception to production rollout, as displayed in the Deployment Progress panel of the illustration, is summarised below. The dates and times are sample values used for illustration.

Stage	Environment	Status	Description Shown	Date and Time (Sample)
1	Development	Deployed	Application configured and ready for deployment.	Oct 8, 2026 • 10:15 AM
2	Stage	Deployed	Application tested and approved in Stage.	Oct 9, 2026 • 11:42 AM
3	Production	Live	Application is live and accessible to end users.	Oct 10, 2026 • 09:20 AM

Result

The following were carried out for the Insurance Claim Request Form application:

- The Environments page under DEPLOY was accessed and the Stage and Production environments were studied.
- The Insurance_Claim_Request and Insurance Claim Request Form applications were seen listed in the environment with the status “Changes available” and “Not yet published” in Stage and Production.
- The development-to-production flow (Development → Stage → Production) was demonstrated through illustrative views, including version 1.0 in Stage and Production and the Deployment Progress panel with Production shown as Live.

Conclusion

The experiment explained how a Zoho Creator application moves from development to production through environments. The Insurance Claim Request Form application is configured in Development, deployed to Stage where it is tested and approved, and then published to Production, where it becomes live and accessible to end users. This staged approach satisfies the testing framework expected of an enterprise release: isolation of work in progress, verification before release, a controlled and traceable promotion path, and Version History for review. It keeps the live insurance claim request pipeline protected from untested changes and downtime, and makes releases controlled and traceable.
