Automated Business Workflow using Deluge Scripting

Application Testing and Debugging — Insurance Claim Request Form (Basic Fields Use Case)

241401104

1. Aim

To design and implement an automated business process workflow within the Insurance Claim Request & Processing Management application in Zoho Creator using Deluge scripting, and to conduct application testing and debugging to verify real-time execution on the Claim_Request_Form built with the thirteen Basic Fields.

Objectives

- To configure a form-level event trigger that automatically executes actions upon successful creation of a claim request record.
- To write custom backend logic in Deluge that reads Basic Field values (Name, Email, Number, Date, Drop Down) and sends an automated acknowledgement email to the claimant.
- To perform end-to-end debugging and live testing to ensure data accuracy and workflow reliability.

2. Procedure

Step 1: Initiating the Workflow Configuration

1. Open the Zoho Creator application in Edit mode.
2. Select Workflows from the left-hand navigation panel.
3. Click on the Create New Workflow button to open the automation setup window.

Step 2: Defining the Trigger Parameters

1. Under the Choose Form dropdown, select the target form: Claim_Request_Form.
2. For the Record Event condition, select Created so the automation runs only when a brand-new claim request is submitted.
3. For the Form Event condition, select Successful Form Submission to trigger the backend actions right after validation of all mandatory fields.
4. Name the workflow clearly as Send Claim Acknowledgement and click Create Workflow.

Illustration of the workflow setup window: form selected, Record Event set to Created, Form Event set to Successful form submission, and the workflow named, ready to be created with the Create Workflow button.

Explanation of the Workflow Setup Window

The workflow setup window defines when the automation runs. The values selected in this step decide whether the acknowledgement email is sent at the right moment and only once per claim.

Setting	Value Selected	Purpose
Choose form	Claim_Request_Form	Links the workflow to the form where claim requests are submitted, so only this form's records activate it.
Record Event	Created	Runs the workflow only when a new claim record is added, not when an existing record is edited or deleted.
Form Event	Successful form submission	Runs the actions after all mandatory fields pass validation and the record is saved.
Workflow Name	Send Claim Acknowledgement	A clear name that identifies the purpose of the workflow.

Why the Record Event is set to “Created”

- The acknowledgement should reach the claimant once, at the time the claim is registered.
- The *Edited* and *Created or Edited* options would send duplicate emails every time a claim record is updated, for example when the claims team changes the status.
- It keeps the claimant's inbox clean and avoids confusing repeated messages.

Why the Form Event is set to “Successful form submission”

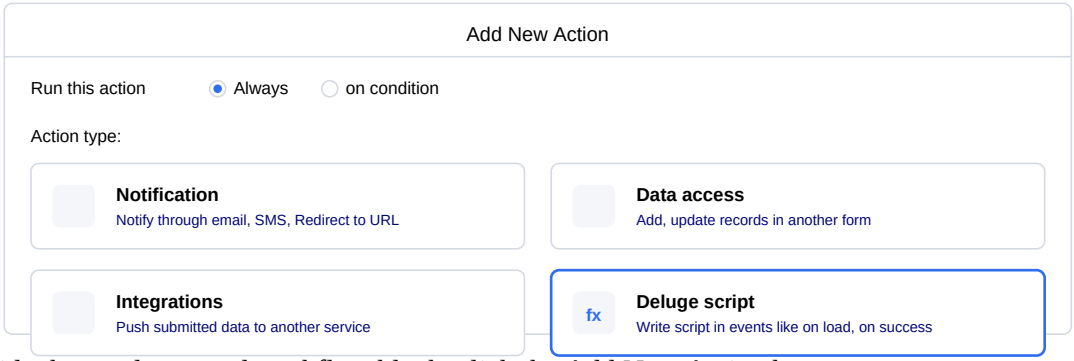
- The script runs only after Zoho Creator has validated the mandatory fields (Claimant Name, Policy Number, Contact Number, Claim Type, Date of Incident and Claim Amount Requested).
- It guarantees that the field values used in the email, such as Policy_Number, Claim_Type and Claim_Amount_Requested, are complete and correct.
- The record is already stored in Claim_Request_Report by this stage, so no acknowledgement is sent for a failed or incomplete submission.

Observations

- After clicking Create Workflow, Zoho Creator opens the workflow canvas showing the path *Claim_Request_Form › Created › Successful form submission › Send Claim Acknowledgement*.
- The trigger is now active and waiting for an action to be attached.
- No errors appeared while creating the workflow. The next step is adding the Deluge script action.

241401104

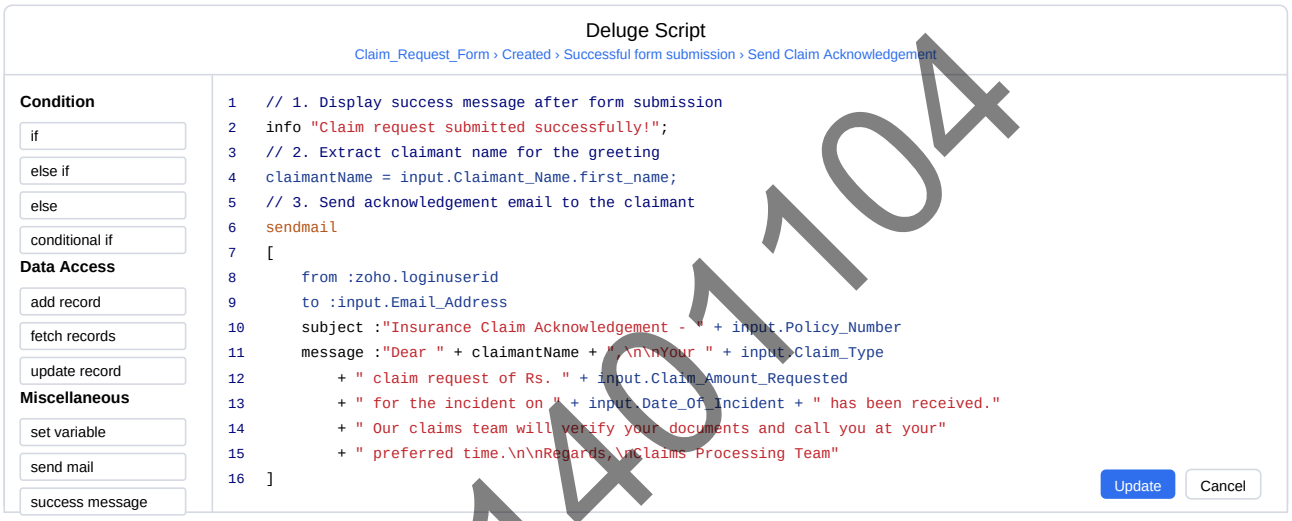
Step 3: Setting up the Action Interface



1. Inside the newly created workflow block, click the Add New Action button.

2. Select Deluge Script from the available option panels to launch the cloud-based Deluge code editor workspace.

Step 4: Developing the Deluge Script



1. Write the backend code inside the editor using Zoho's Deluge syntax. The script shows a success message, reads the claimant's first name from the Name field, and builds the email text from the Policy_Number, Claim_Type, Claim_Amount_Requested and Date_Of_Incident fields.

2. Implement a sendmail block using the system variable (zoho.loginuserid) as the sender and the Email_Address field as the recipient.

3. Define strict parameter pairs within the bracket block, ensuring correct spacing for the tags (from:, to:, subject:, message:).

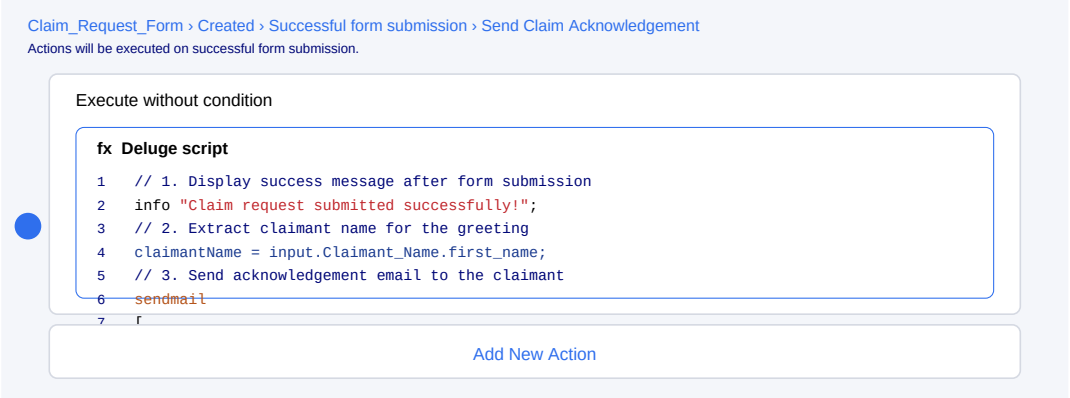
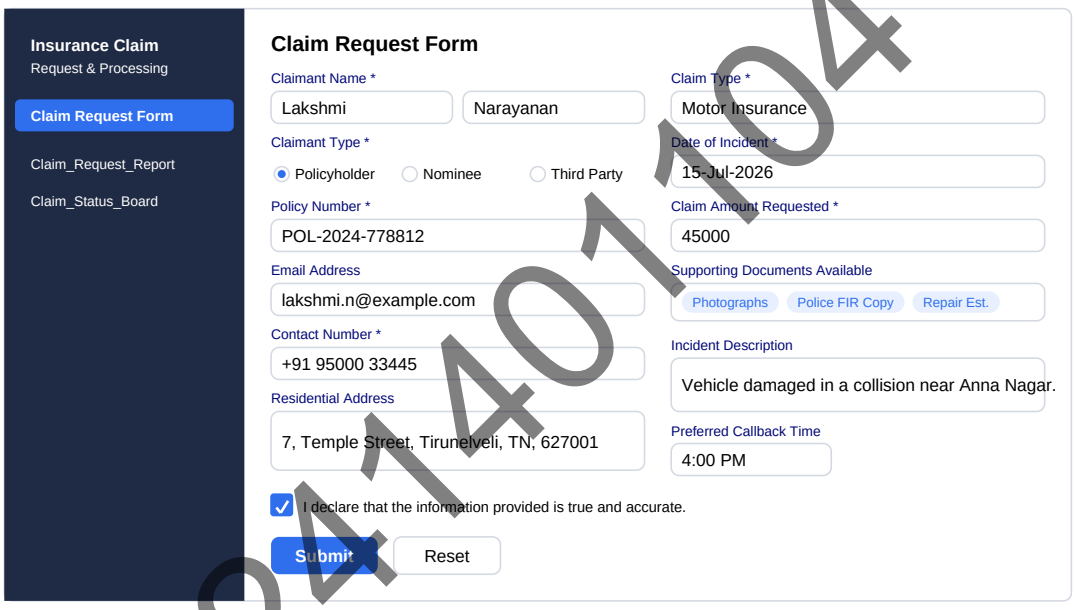
Step 5: Compiling and Saving



1. Review the code to eliminate syntax errors, mismatched brackets, or missing string quotation marks.
2. Click the blue Update/Save button in the lower right corner to compile the code and push the workflow script live.

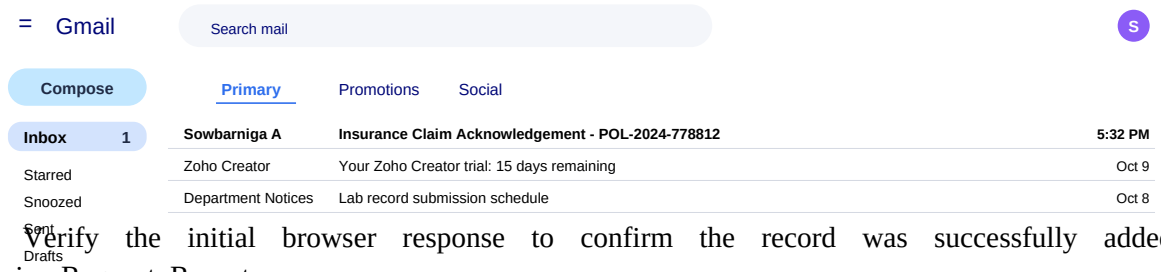
Step 6: Executing Live Application Testing



1. Switch the application from the editor environment to the live User View.
2. Open the live Claim_Request_Form.
3. Populate all fields with sample data (Sample Record 1) and enter a valid, accessible test email address.
4. Click the form's Submit button.

241401104

Step 7: Validation and Debugging Analysis

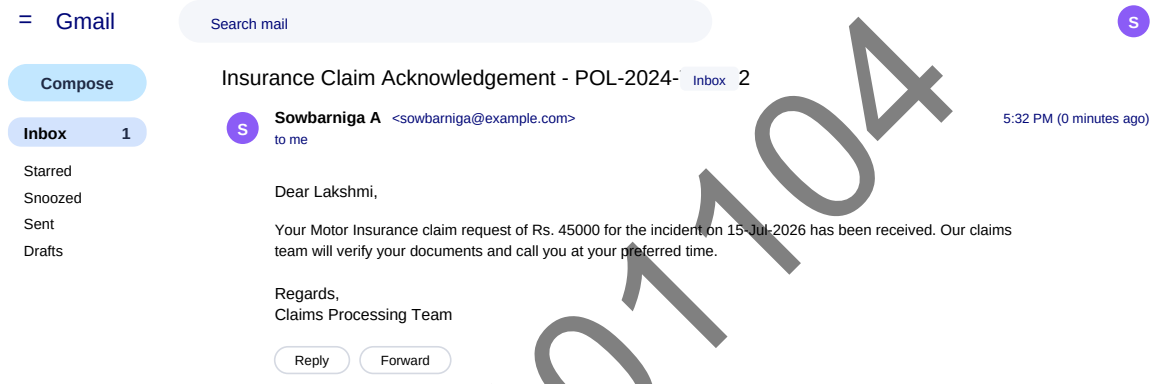


1. Verify the initial browser response to confirm the record was successfully added to Claim_Request_Report.

2. Log into the target email client inbox.

3. Check the primary inbox and spam folder to confirm that the automated "Insurance Claim Acknowledgement" email arrived without delay.

3. Output



Workflow Activation: The back-end automation trigger was mapped to the Claim_Request_Form submission event without any compilation or system errors.

Script Validation: The written Deluge code passed Zoho Creator's syntax checks and was saved to the application.

Live Execution Verification

- Filling out and submitting the live form correctly generated a new record in Claim_Request_Report.
- The backend script triggered instantaneously upon form submission.
- An automated "Insurance Claim Acknowledgement" email was routed and delivered to the claimant's inbox.

Result

The successful execution of this exercise demonstrates the power of low-code automation. By combining the Basic Fields of the Claim_Request_Form with a targeted Deluge workflow that sends automated acknowledgements, the Insurance Claim Request & Processing Management application has moved from a passive data-collection form to an active system that confirms every claim request the moment it is submitted.
